Control a remote machine from your mobile, **with Telegram!**

TPRCIC 2020

The project
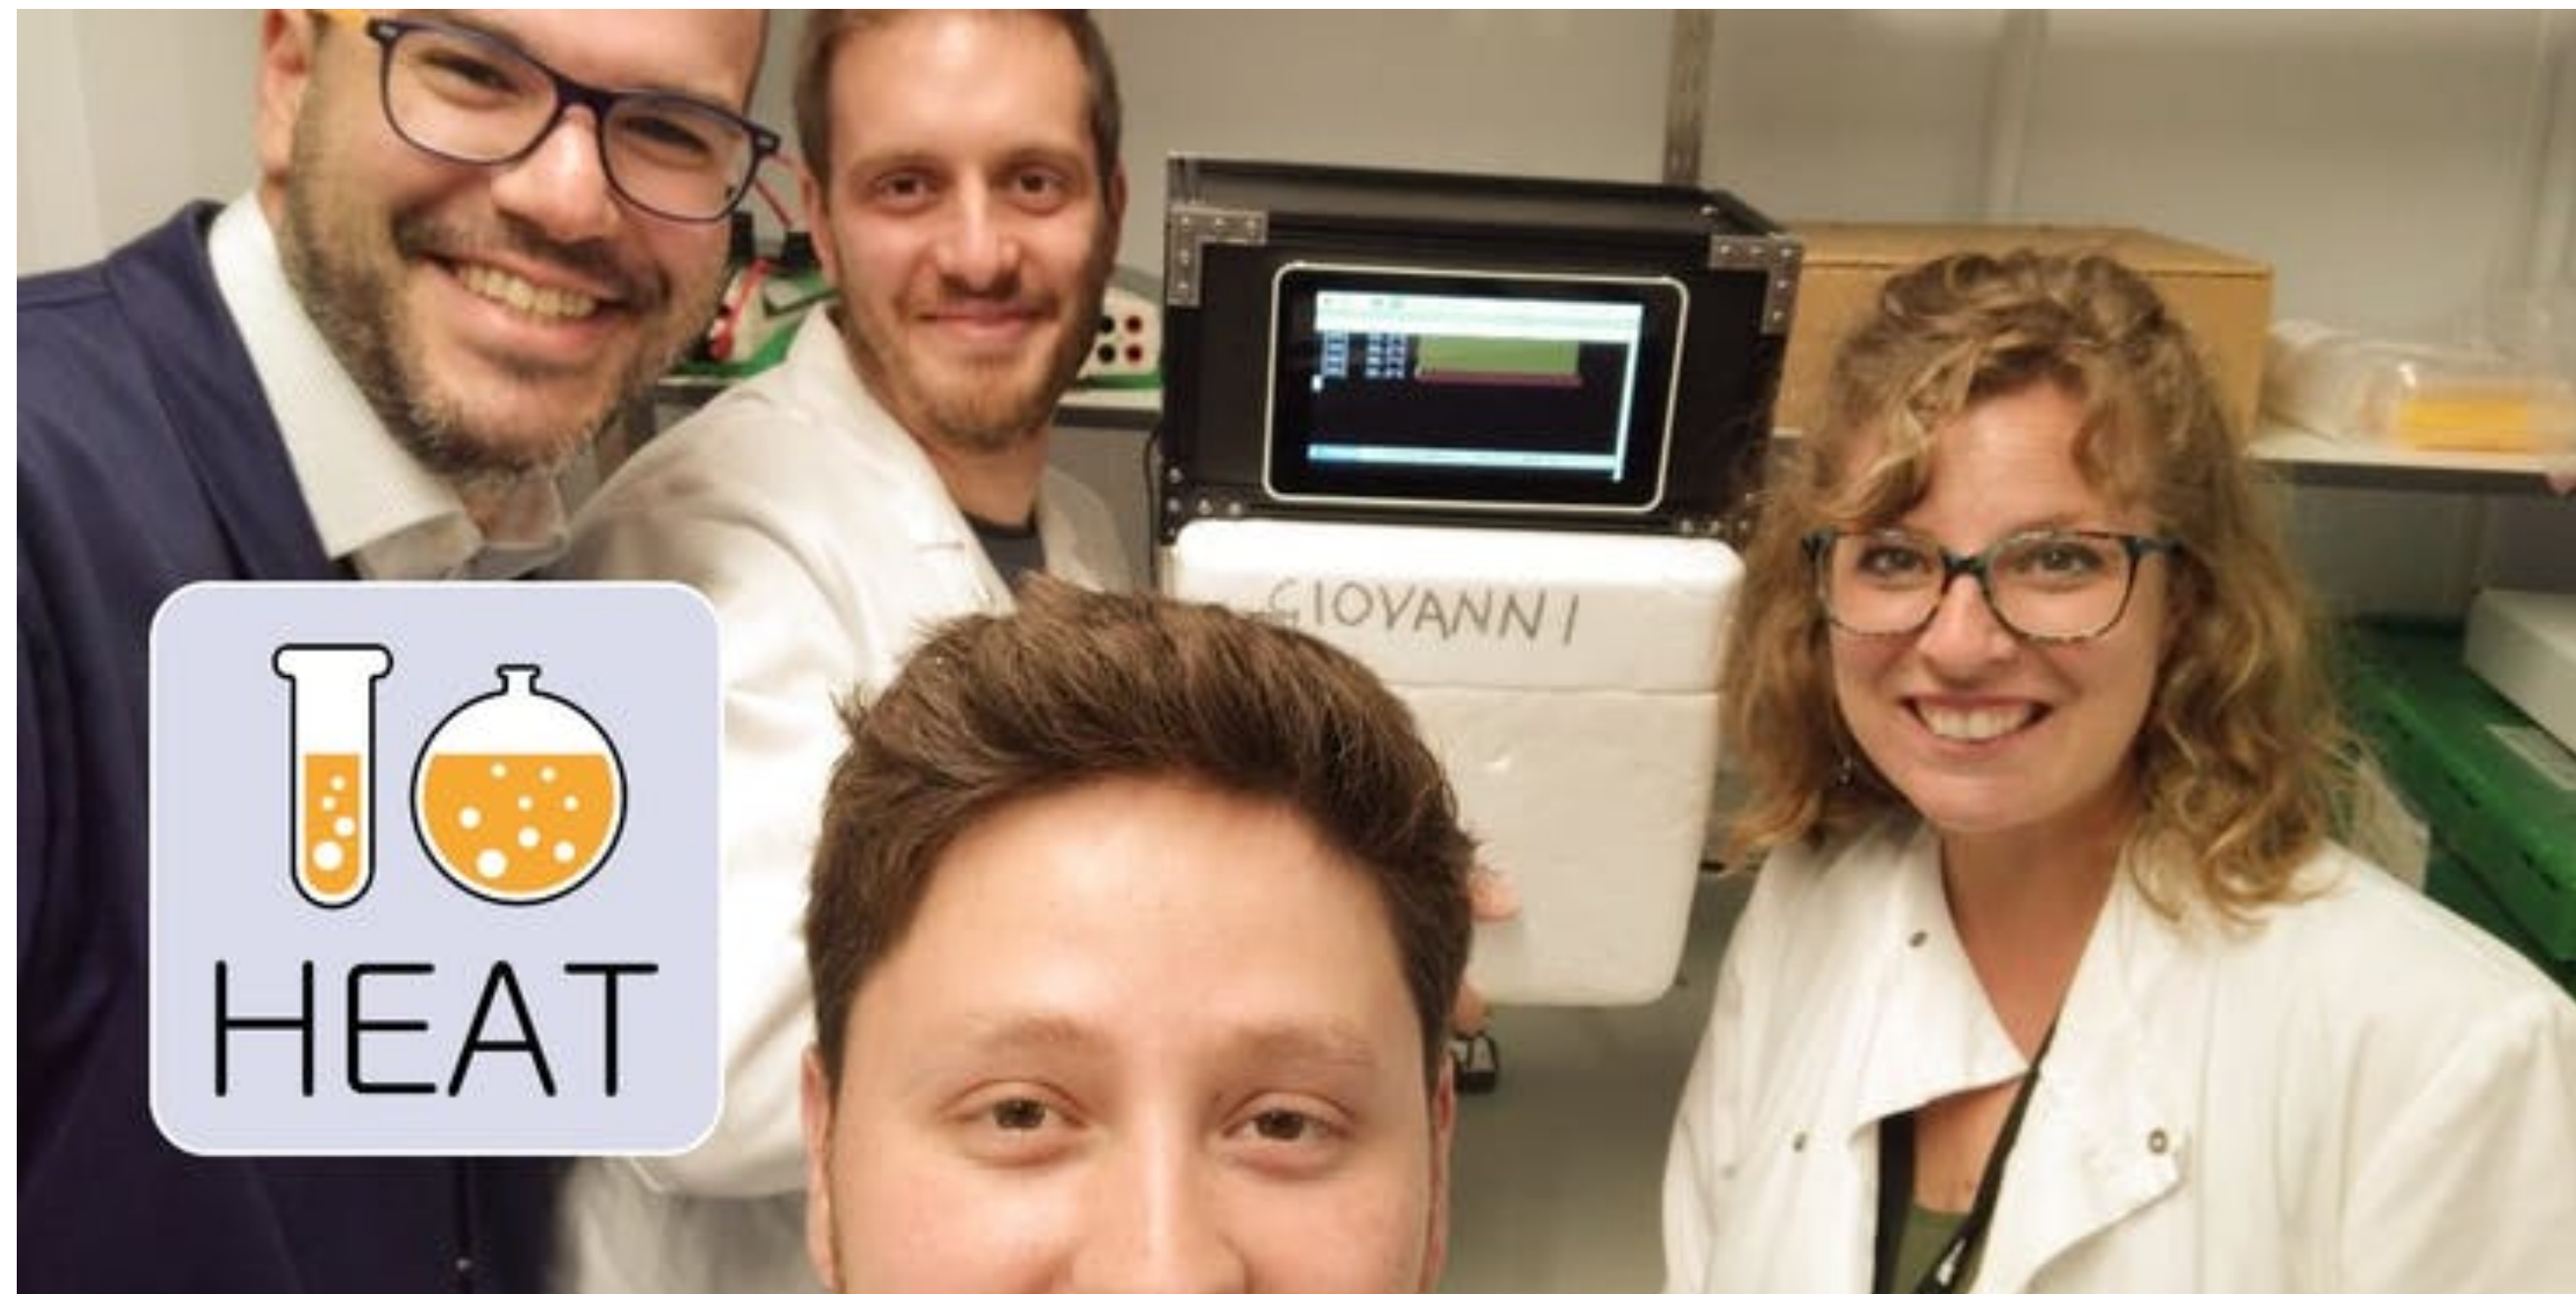

**HTTPS://WWW.HACKSTER.IO/IOHEAT/**

- A device to heat lab flasks 🧪

- That is remotely controlled to start the heating when leaving home 🏠

- 👨‍🔬 ➡️ 😊

The problem

- It sits inside an academic laboratory with internet access but closed firewall (⛔ hosting a server in the Raspberry Pi)

- Using a web server to receive status from Rasberry Pi + instructions from the user would make the development taking forever 🕸
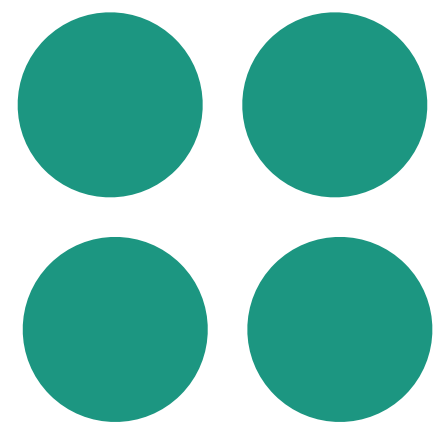

The solution
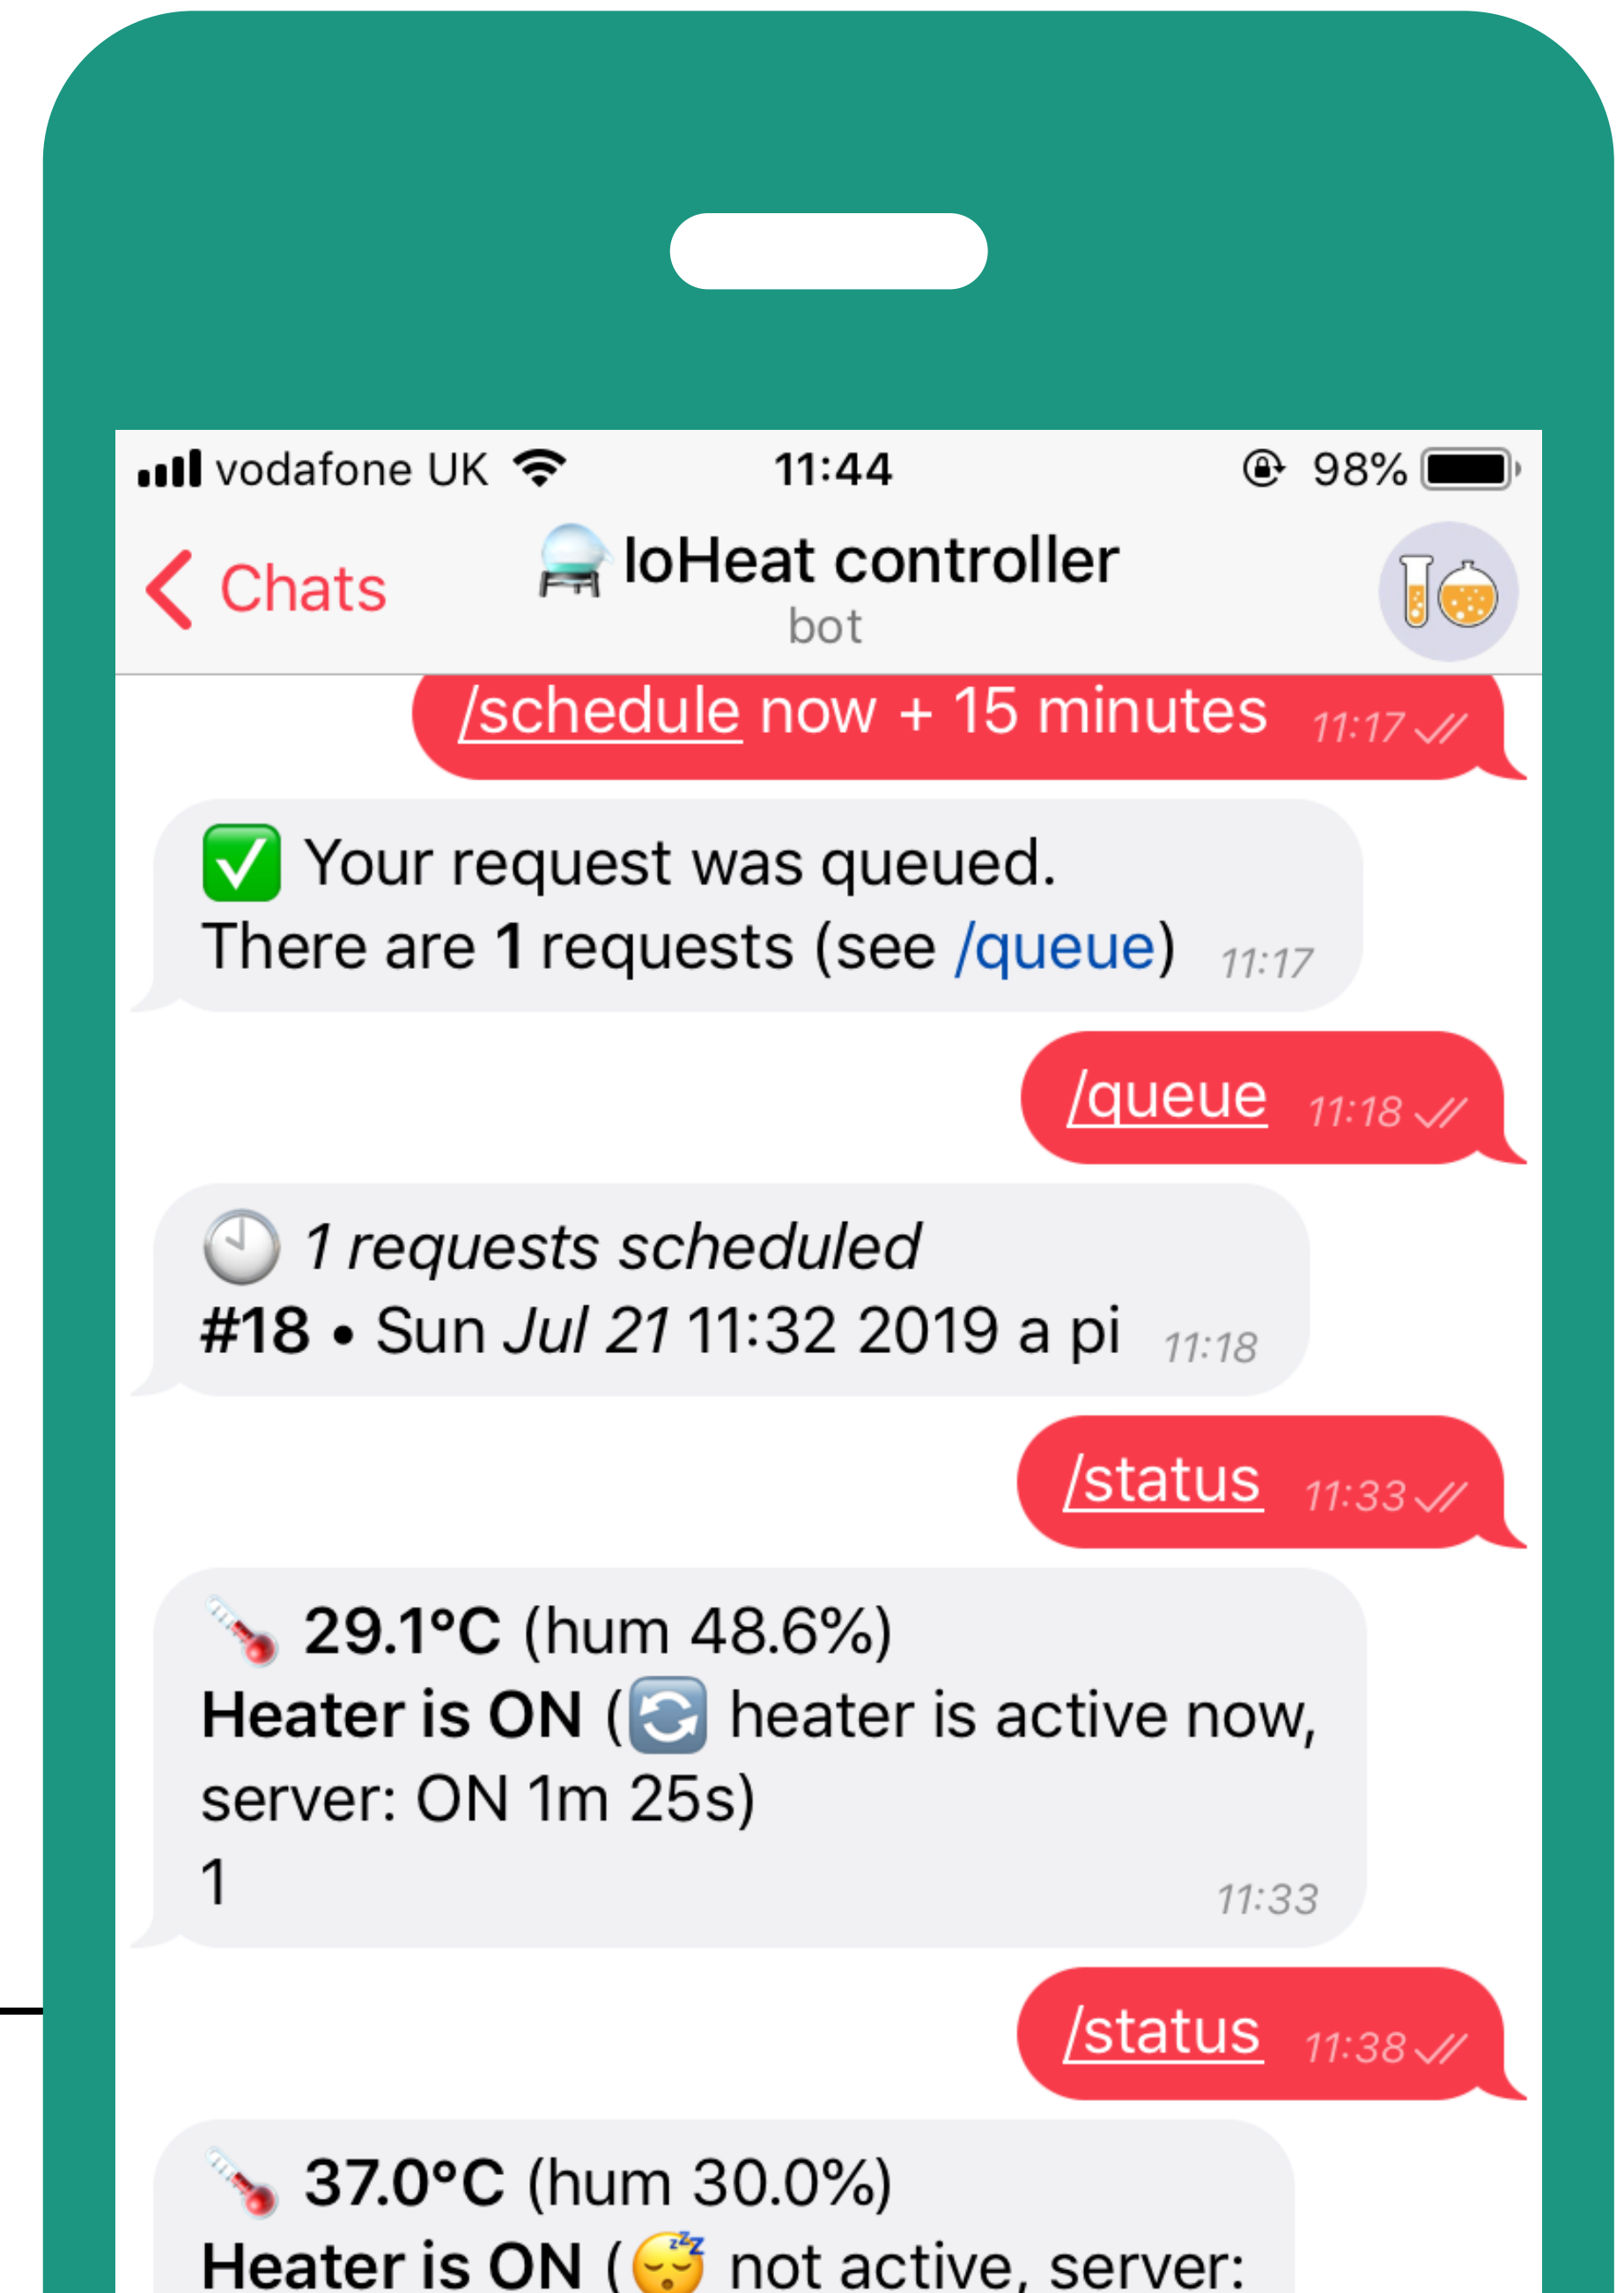

WWW::Telegram::BotAPI to the rescue

```
use WWW::Telegram::BotAPI;

my $api = WWW::Telegram::BotAPI→new( token ⇒ $TOKEN );

…
```
